- measurement independent of color and soiling through tracking of the laser power
- ✓ background suppression through triangulation
- ✓ synchronization input
- ✓ less than 900µsec response time
- ✓ excellent linearity thanks to microprocessor
- ✓ additional alarm output for the measuring range
- high resolution for very precise measuring accuracy
- ✓ 5 different measuring ranges from 30 to 1000mm teachable with external teach-in
- ✓ rotatable M12-connector, 8-pin
- ✓ red light laser with glass lens
- ✓ laser protection class 2
- ✓ robust metal housing made of zinc diecast

analog signal 4 to 20mA / 0 to 10V 5 teachable measuring ranges

description

ipf laser distance sensors operate with measuring ranges from 30 to 1000mm. The compact sensors with integrated microcontroller provide a precise output signal, which is proportional to the measured distance. An intelligent, internal signal analysis enables the sensor to precisely detect object distances, regardless of the color and and structure of most surfaces.

Distances to rough surfaces can be measured reliably, when a device is used that has a fine laser line instead of a laser spot. The evaluation electronics calculate a mean value for the illuminated area.

The sensor can always be aligned easily and exactly using the small, visible laser spot.

When it is turned on, the sensor checks if a current is flowing at the current output. If this is the case, the current output is activated, if not, the voltage output is activated after 100msec.

A PNP switching signal triggers the alarm output if the measuring range is left. This is additionally signalled by a red LED lighting up.

The resolution is dependent on the position of the object (start/end of the measuring range) and the effective

taught-in measuring range.

analog

The implemented power tracking of the laser exposure ensures that the same signal quality is always maintained on light and dark surfaces, making the sensor "color blind". In addition, that also compensates for possible soiling of the lens.

Alarm

•)))

DC

There is an additional synchronization input for time-synchronized measuring tasks, such as the measuring of object thicknesses. Measurements of different sensors can be started at the same time, using an external signal.

application examples

- precise measuring and positioning tasks in many different application areas
- presence check of different objects
- monitoring and highly precise measurement of object and stacking heights
- contactless position and thickness measurement of small and large parts
- color-independent recognition of even the smallest objects

triangulation principle

Warning

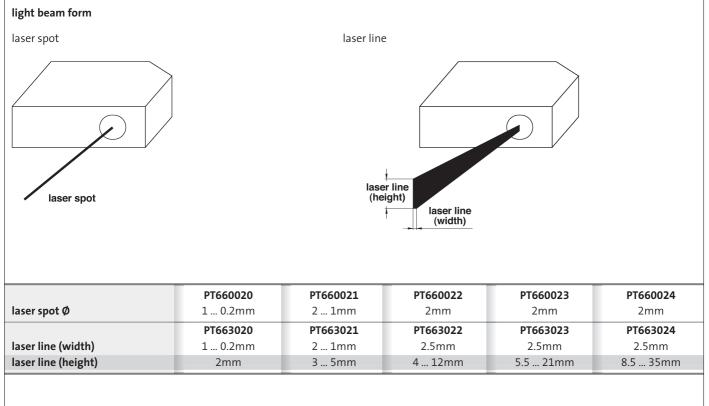

according to DIN EN 60825 wavelength 630 ... 680nm max.output power 1mW

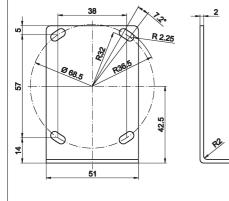

The distance measurement is based on the triangulation principle. The laser beam is emitted by the transmitter diode and hits the object as a small spot. The sensor's receiver element detects the position of this spot within the "detection range". The sensor basically measures the angle of this position and then calculates the adequate distance. There is a "blind range" directly in front of the sensor where the objects are not reliable recognized.

This data sheet contains the standard versions only. Kindly request the availability of other output- and connection functions.

We will be pleased to supply the matching cable socket for your devices with connector. Please refer to the list in catalog chapter "accessories" under "cable sockets **ipf**-SENSORFLEX®" or search our website for "VK".

Warning: Never use these devices in applications where the safety of a person depends on their functionality.
